DOCKER

STREAMLIT

Real dataset (307,511 applicants) · end-to-end, dockerized, verified

Faster, Explainable Credit Decisions

The business problem

- ▶ Identify high-risk loan applicants early
- ▶ Automate risk scoring and decision support
- ▶ Provide explainable reasons for every classification
- ▶ Satisfy audit and regulatory requirements
- ▶ Let analysts explore data in plain English
- ▶ Bridge ML insights with real credit policy

What we delivered

- ✓ EDA with 5 business insights
- ✓ LightGBM model + evaluation metrics
- ✓ SHAP explainability, per-applicant
- ✓ Auto-derived business rules
- ✓ Gemini-powered talk-to-data chatbot
- ✓ Dockerized, one-command deployment

End-to-End Architecture

Every layer is independently testable — the Streamlit UI is a thin wrapper over `src/`, not where the logic lives.

Every Weighted Criterion, Covered

Evaluation Area	Weight	What We Built
ML solution design & model quality	30%	LightGBM + 5-fold CV, scale_pos_weight, cost-optimal threshold, PR-AUC-driven selection
LLM integration & NL-to-SQL	25%	Gemini-backed chatbot + 10 built-in fallback query patterns, zero-key operation
Prompt optimization & hallucination control	15%	sqlglot validation, table/column allow-list, mandatory LIMIT, response caching
EDA	15%	134-feature categorization, missing-value audit, 5 business insights with charts
Dockerization & engineering quality	10%	Multi-stage Dockerfile, docker-compose (app + Postgres), 17 passing unit tests
Documentation & architecture clarity	5%	Full README, Colab guide, data-source docs, inline design-rationale comments

One Platform, Five Sections

Real numbers from the real dataset on load — 307,511 applicants, a trained model, and a live Gemini connection.

118 numeric + 16 categorical features, auto-categorized straight from the raw schema — no manual column typing.

Missingness Is Signal, Not Noise

Data quality: missing values

Top columns by missing-value fraction

No imputation

LightGBM splits on missing values natively — filling them would destroy real signal.

Housing metadata

Top missing columns describe apartment/building details, not core risk fields.

EXT_SOURCE_1 gap

~56% missing by design in the real dataset — the gap itself is mildly predictive.

Income Type Predicts Default Risk

Business insights

1. Default rate by income type 2. External score vs default 3. Credit-to-income vs default 4. Age vs default 5. Bureau history vs default

Default rate by income type

Insight: Income type is a strong, policy-actionable segmentation variable – some income types default several times more often than others, which should feed directly into underwriting tiers.

Insight: Maternity leave and Unemployed applicants default 4–6x more often than Working or State servant applicants — a strong, policy-actionable underwriting signal.

4 more insights (external score, credit-to-income, age, bureau history) are live in the app's EDA page.

Cost-Optimal, Not Accuracy-Optimal

```
!python -m src.ml.evaluate
```

```

Applicant details

Income type	Age (years)	External score 1 (bureau)
Working	38	0.50
Education	Years employed	External score 2 (bureau)
Secondary / secondary special	6	0.50
Family status	Annual income	External score 3 (bureau)
Married	180000	0.50
Gender	Requested credit amount	Region risk rating (1=best, 3=worst)
F	600000	2
Owns a car?	Monthly annuity	Prior credits at other lenders
N	28000	2
Owns real estate?	Goods price	...of which still active
Y	580000	1
		Any overdue prior credit?
		No

SCORE APPLICANT

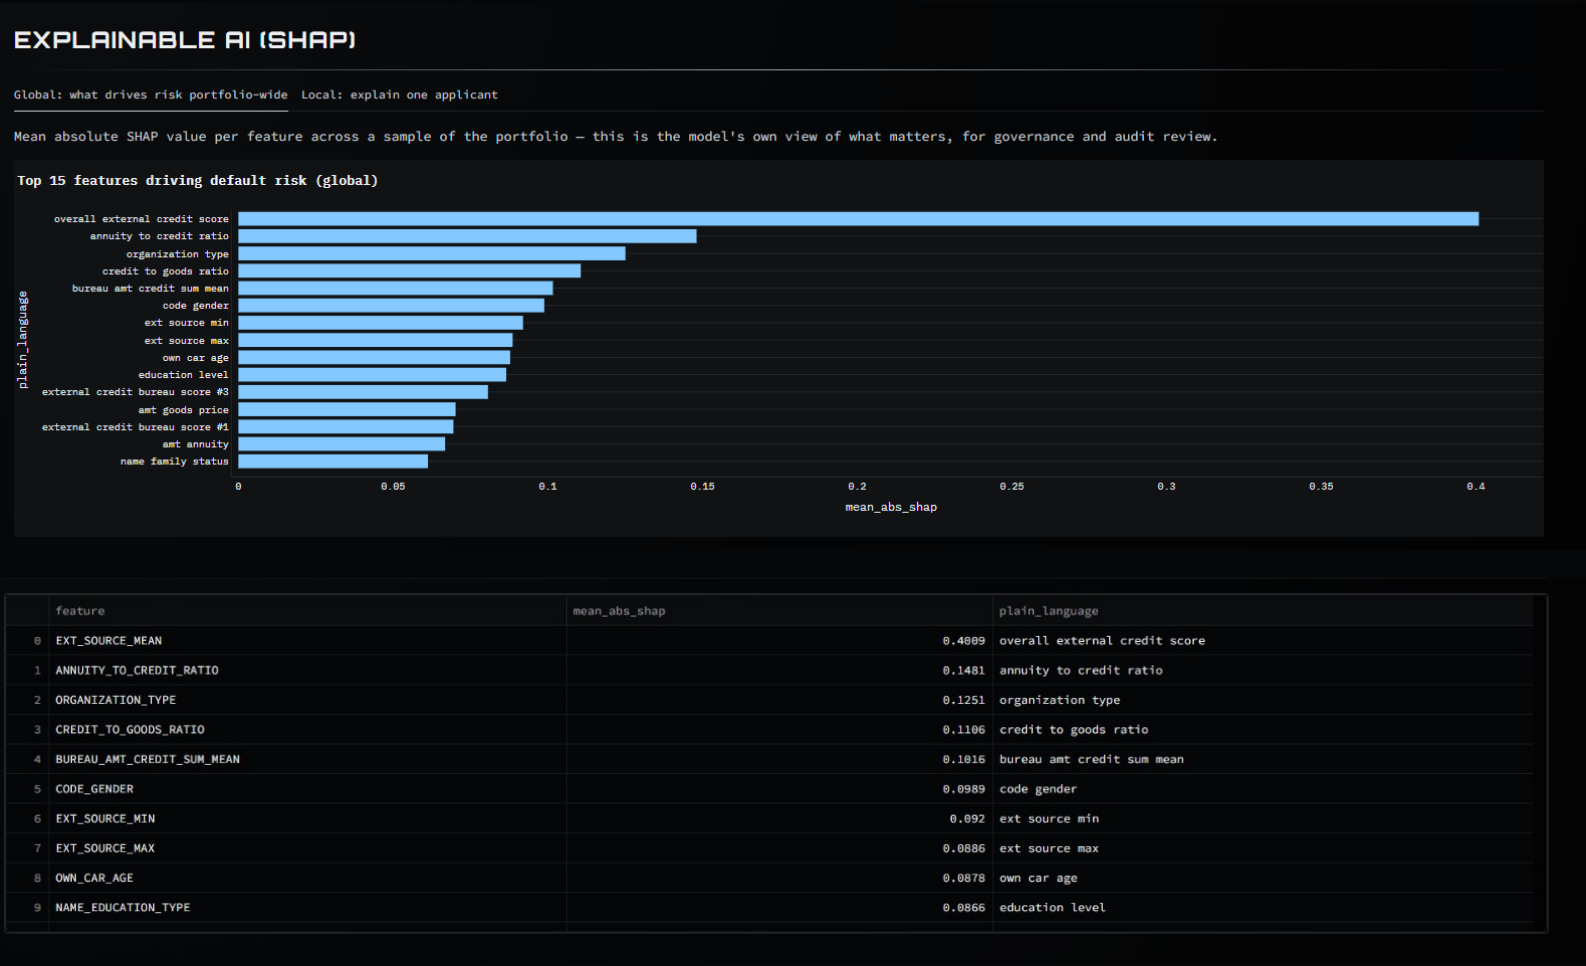

Result

DEFAULT PROBABILITY	RISK BAND	SUGGESTED DECISION
28.7%	LOW	Approve

Head to the [Explainability](#) page to see exactly which factors drove this specific prediction (SHAP), or [Business Rules](#) for the auditable rule that matches this risk band.

Every prediction pairs a probability with a plain risk band and a suggested decision — ready for a credit officer, not just a data scientist.

Every Prediction, Explained

SHAP TreeExplainer, global + per-applicant — overall external credit score dominates, matching every published analysis of this dataset.

The Model, Distilled Into Policy

BUSINESS-READABLE DECISION RULES

These rules are distilled from the trained ML model, not hand-written – a shallow decision tree is fit to reproduce the model's own Low/Medium/High risk-band output, then converted into plain-English IF/THEN statements. Each rule reports:

- Coverage (support): how many applicants it applies to
- Agreement: what fraction of those applicants the rule correctly matches to the model's actual output (i.e. rule fidelity, not ground-truth accuracy)

Use these to explain credit policy to non-technical stakeholders or auditors without exposing raw model internals.

RE-DERIVE RULES FROM CURRENT MODEL

Filter by predicted band

LOW

MEDIUM

HIGH

3 rule(s)

- IF overall external credit score ≤ 0.538 AND overall external credit score ≤ 0.339 AND ext source min > 0.149 AND income source type > 0.206 THEN predicted risk = High (covers 16613 applicants, 61% agreement with the ML model)
- IF overall external credit score ≤ 0.538 AND overall external credit score ≤ 0.339 AND ext source min ≤ 0.149 AND overall external credit > score ≤ 0.258 THEN predicted risk = High (covers 12696 applicants, 90% agreement with the ML model)
- IF overall external credit score ≤ 0.538 AND overall external credit score ≤ 0.339 AND ext source min ≤ 0.149 AND overall external credit score > 0.258 THEN predicted risk = High (covers 8040 applicants, 68% agreement with the ML model)

Medium

7 rules(s)

- IF overall external credit score ≤ 0.538 AND overall external credit score > 0.339 AND overall external credit score > 0.432 AND credit to goods ratio > 1.14 THEN predicted risk = Medium (covers 34862 applicants, 72% agreement with the ML model)
- IF overall external credit score ≤ 0.538 AND overall external credit score > 0.339 AND overall external credit score > 0.432 AND credit to goods ratio > 1.14 THEN predicted risk = Medium (covers 34862 applicants, 72% agreement with the ML model)
- IF overall external credit score ≤ 0.538 AND overall external credit score > 0.339 AND overall external credit score > 0.432 AND credit to goods ratio > 1.14 THEN predicted risk = Medium (covers 34862 applicants, 72% agreement with the ML model)
- IF overall external credit score ≤ 0.538 AND overall external credit score > 0.339 AND overall external credit score > 0.432 AND credit to goods ratio > 1.14 THEN predicted risk = Medium (covers 34862 applicants, 72% agreement with the ML model)
- IF overall external credit score ≤ 0.538 AND ext source max ≤ 0.681 AND bureau amt credit sum mean > 3.31e+04 AND credit to goods ratio > 1.14 THEN predicted risk = Medium (covers 24292 applicants, 80% agreement with the ML model)
- IF overall external credit score ≤ 0.538 AND ext source max ≤ 0.681 AND bureau amt credit sum mean > 3.31e+04 AND credit to goods ratio > 1.14 THEN predicted risk = Medium (covers 24292 applicants, 80% agreement with the ML model)
- IF overall external credit score ≤ 0.538 AND ext source max ≤ 0.681 AND bureau amt credit sum mean > 3.31e+04 AND credit to goods ratio > 1.14 THEN predicted risk = Medium (covers 24292 applicants, 80% agreement with the ML model)

Ask the Portfolio a Question

What is the default rate by income type?

Here are the top results for your question (8 row(s) shown):

- Income type: Maternity leave, Default rate: 40.00%, Applicants: 5
- Income type: Unemployed, Default rate: 36.36%, Applicants: 22
- Income type: Working, Default rate: 9.59%, Applicants: 158,774
- Income type: Commercial associate, Default rate: 7.48%, Applicants: 71,617
- Income type: State servant, Default rate: 5.75%, Applicants: 21,703

Show generated SQL

	name_income_type	default_rate	n
0	Maternity leave	0.4	5
1	Unemployed	0.3636	22
2	Working	0.0959	158774
3	Commercial associate	0.0748	71617
4	State servant	0.0575	21703
5	Pensioner	0.0539	55362
6	Businessman	0	10
7	Student	0	18

Which region has the highest risk?

Here are the top results for your question (3 row(s) shown):

- Region rating: 3.00, High-risk share: 23.98%, Applicants: 48,330.00
- Region rating: 2.00, High-risk share: 13.97%, Applicants: 226,984.00
- Region rating: 1.00, High-risk share: 5.36%, Applicants: 32,197.00

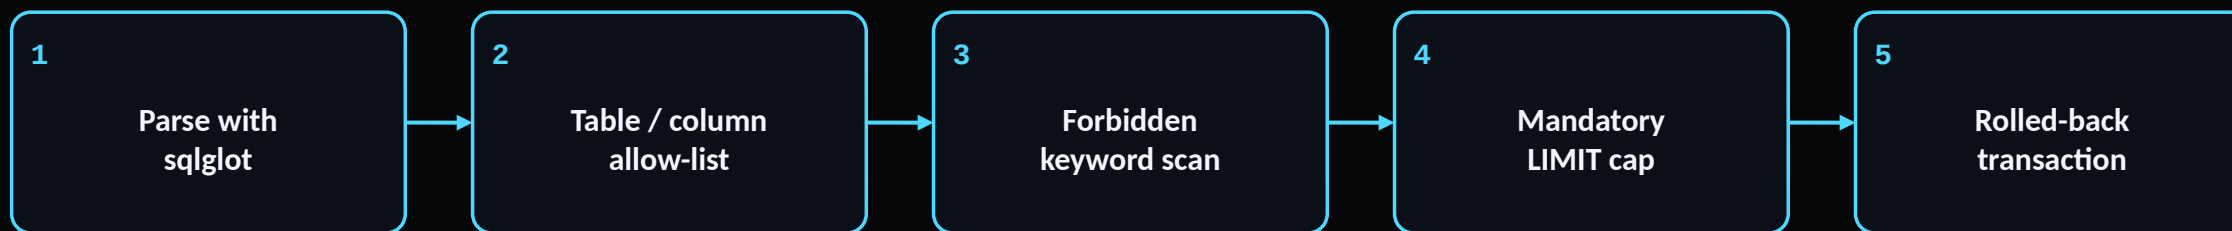

Show generated SQL

	region_rating_client	high_risk_share	n
0	3	0.2398	48330
1	2	0.1397	226984
2	1	0.0536	32197

Natural language → validated SQL → plain-English answer. Every query passes table/column allow-listing before it ever touches the database.

Guardrails Before Generation

The enforcement layer is code, not a polite prompt request.

Token optimization

- ▶ Condensed schema injection (~150 tokens) — not a full DDL dump or sample rows
- ▶ 6 shape-diverse few-shot examples, not exhaustive question coverage
- ▶ Response cache — repeated questions cost zero additional tokens
- ▶ Compact CSV results, never a full DataFrame dump, sent to the LLM

One Command, Two Paths

Docker (evaluator / production)

- ▶ docker-compose up — app + Postgres containers
- ▶ Multi-stage Dockerfile, non-root user, healthchecks
- ▶ Auto-trains on first boot, persists via named volumes
- ▶ Model artifact skips retraining on restart

Google Colab (training / verification)

- ▶ Mount Drive → extract real dataset → train on full 307K rows
- ▶ No Docker needed — SQLite backs the chatbot locally
- ▶ Streamlit tunneled out via cloudflared for a public URL

```
%cd /content/credit_risk_platform_deploy

!nohup cloudflared tunnel --url http://127.0.0.1:8501 > /content/cloudflare.log 2>&1 &

/content/credit_risk_platform_deploy

!grep -o 'https://[-a-zA-Z0-9]*\.trycloudflare\.com' /content/cloudflare.log | head -1
... https://lending-displayed-compensation-ought.trycloudflare.com
```

Known Limitations & Future Work

Now

- ▶ Bureau features are simple aggregates — previous_application.csv and installments_payments.csv are not yet joined
- ▶ Surrogate rule tree is a deliberate simplification; it reports its own agreement rate rather than hiding disagreement
- ▶ Chatbot queries a single flattened table — no multi-table natural-language joins yet
- ▶ No model monitoring or drift detection

Next

- ▶ Wire in installment & POS-cash history for deeper features
- ▶ Formal fair-lending review — age and gender carry real signal and need compliance sign-off before real-world use
- ▶ Multi-table chatbot schema for richer natural-language joins
- ▶ Score-drift monitoring dashboard for production use
